

8 Leg Mobile Roof Anchor

When you're in a location where it's not viable to fit a guard rail, the Altitude Safety Mobile Man Anchor provides an easy cost effective solution without compromising safety.

The mobile man anchor system splits into pieces which allow it to be easily transported, and is fast and easy to assemble. The 8 Leg version of the Mobile Man Anchor is only required on steel or PVC membrane roofs. At 340kg its extra weight prevents any possible movement of the anchor on the smoother surfaces of these roof surfaces.

The components are exactly the same as our 6 leg product, with the addition of 2 extra steel weights, 2 extra rubber weights and an 8 leg central anchor point. The steel weights have 5mm rubber protection pads fitted, this prevents any possible damage to susceptible roof surfaces and provides better grip on all surfaces

Our Mobile Man Anchors have been tested to Standard.EN795.1997 by Satra Technology Centre on the following surfaces in both dry and wet conditions.

- Steel Roof
- PVC Membrane Roof
